***Subject: 2018 Focused Quino Checkerspot Butterfly Survey Report for the Campo Wind Project, Campo, San Diego County, California***

Dear Ms. Love:

This letter report documents the spring 2018 results of a focused survey conducted by Dudek for the federally listed endangered Quino checkerspot butterfly (*Euphydryas editha quino*; Quino). This survey was conducted in support of the Campo Wind project located within the community of Campo, San Diego County, California. This report is intended to satisfy reporting requirements for the following Quino-permitted biologists: Anita Hayworth (TE-781084-9.1), Callie Amoaku (TE-36118B-1), Darin Busby (initially working under Melissa Busby's permit until permit renewal of TE-115373-4), David Erik LaCoste (TE-027736-6), Diana Saucedo (TE-221287-1), Erin Bergman (TE-813545-5), Jeff Priest (TE-840619-6), Margie Mulligan (TE-88969B-0), Melissa Busby (TE-0807792-3), Patricia Schuyler (TE-27502B-1), Paul M. Lemons (TE-051248-5), and Tricia Wotipka (working under TE-840619-6).

## **PROJECT LOCATION AND EXISTING CONDITIONS**

The proposed project site is located on tribal lands within the community of Campo in San Diego County, California, on Assessor's Parcel Numbers 608-101-01, 608-110-06, 608-110-07, 608-120-01, 608-120-02, 608-120-03, 608-120-04, 608-120-05, 609-020-08, 609-040-16, 609-050-15, 609-050-16, 609-110-01, 609-130-16, 609-140-01, 609-150-01, 610-020-05, 610-020-06, 610-080-08, 610-080-09, 610-080-17, 610-110-23, 610-130-01, 610-130-02, 610-130-03, 610-130-04, 610-130-05, 610-130-06, 610-130-07, 657-020-06, 657-030-01, 657-030-02, 657-080-09, 657-100-01, 657-100-02, 657-110-01, 657-110-02, 658-010-01, 658-070-03, 658-070-16, 658-130-01, 658-130-02, 760-120-12, and 760-120-13 (Figure 1, Survey Results – Index). The study area consisted of the proposed wind turbine locations with a 250-foot-wide buffer (total of 500-foot-wide area), and associated roads and infrastructure. In early April, the study area was modified slightly, resulting in 0.6 acres being removed from the study area and 45.7 acres being added (Figures 2 and 3, Survey Results). The additional areas were slivers of land adjacent to the

existing survey areas that were within the line of sight from the Weeks 1 through 4 surveys; therefore, the addition of these areas does not change the conclusions of the report.

The project site is located on the Campo Band of Kumeyaay Indians Reservation in southeastern San Diego County, approximately 60 miles east of the City of San Diego, California, in the vicinity of the unincorporated communities of Campo, Boulevard, and Live Oak Springs. The project site's elevation is between approximately 3,153 and 4,168 feet above mean sea level. The Campo Band of Kumeyaay Indians Reservation includes lands both north and south of Interstate 8 along the Tecate Divide, extending from the southern boundary of the Manzanita Indian Reservation to the north and south to 0.25 miles north of the U.S. international border with Mexico. The project site is within the U.S. Geological Survey's 7.5-minute Live Oak Springs, Cameron Corners, Tierra Del Sol, and Campo quadrangle maps within Township 17 South, Range 6 East, Sections 01, 12, 13, 14, 15, 20, 21, 22, 23, 27, 28, 33, and 34; Township 17 South, Range 7 East, Section 06; and Township 18 South, Range 6 East, Sections 03, 04, 05, 08, 09, 10, 11, 14, 15, 16, 17, 20, and 21.

The project site includes undeveloped land as well as paved and dirt roads. Additionally, the site is characterized by rural, large-lot ranches and single-family homes, as well as an old sand mine.

According to the U.S. Department of Agriculture, Natural Resources Conservation Service, the following seven soil series were mapped on site: Calpine (coarse sandy loam, 5% to 9% slopes, eroded); Kitchen Creek (loamy coarse sand, 5% to 9% slopes; loamy coarse sand, 9% to 15% slopes, eroded); La Posta (loamy coarse sand, 5% to 30% slopes, eroded; loamy coarse sand, 5% to 30% slopes, severely eroded; rocky loamy coarse sand, 5% to 30% slopes, eroded); loamy alluvial land; Mottsville (loamy coarse sand, 0% to 2% slopes; loamy coarse sand, 2% to 9% slopes; loamy coarse sand, 9% to 15% slopes); and Tollhouse (rocky coarse sandy loam, 30% to 65% slopes; rocky coarse sandy loam, 5% to 30% slopes, eroded) (USDA 2018).

## **VEGETATION COMMUNITIES**

Vegetation communities are currently being mapped and the data is not yet finalized. In general, the project site supports chaparral, scrub, grassland, and oak woodland communities.

## **QUINO CHECKERSPOT BUTTERFLY SURVEY**

### **Background Information**

The Quino was added to the federal Endangered Species List by the U.S. Fish and Wildlife Service on January 16, 1997 (62 FR 2313–2322). The species, Edith's checkerspot (*E. editha*),

has a range extending from British Columbia and Alberta, Canada, south through Colorado and Utah, and west along the coast to northern Baja California. It is divided into 20 subspecies, each of which has its own range and biological and morphological characteristics. In California, there are 12 subspecies (Garth and Tilden 1986). Three other subspecies of *E. editha* are currently known to occur in Southern California. The Quino (*E. editha quino*) is the southwesternmost subspecies of *E. editha* (Mattoni et al. 1997).

The Quino is known to occur in association with a variety of plant communities, soil types, and elevations (up to 5,000 feet). The plant communities include clay soil meadows, open grasslands, coastal sage scrub, chamise chaparral, red shank chaparral, juniper woodlands, and semi-desert scrub (Ballmer et al. 2001). The Quino is also associated with clay soils that possess cryptogamic crusts and vernal pools (USFWS 2002).

The Quino is a medium-sized butterfly (approximately 0.8-inch to 1.1-inch wingspan) belonging to the family Nymphalidae. The adults are primarily orange-red with white and have black markings on the dorsal wing surface. They are active primarily in March and April. This active period may vary depending on weather conditions (Ballmer et al. 2001). The adult butterfly feeds on nectar, which it obtains from spring annuals such as popcorn flower (*Plagiobothrys* spp., *Cryptantha* spp.), whitedaisy tidytops (*Layia glandulosa*), goldenbush (*Ericameria* spp.), pincushion (*Chaenactis* spp.), fiddleneck (*Amsinckia* spp.), chia (*Salvia columbariae*), and bluedicks (*Dichelostemma capitatum*), among others.

Adult males and virgin females sometimes “hilltop,” or travel to elevated locations to find mates. While waiting for females to arrive, the males will often exhibit territorial behavior and will chase other butterflies that approach them. Frequently, the butterflies are observed in meadows or clearings where their host plants occur (Ballmer et al. 2001).

A female may lay 20 to 75 eggs at one time and may produce up to 1,200 eggs in her lifetime. The eggs hatch in approximately 10 days under favorable weather conditions and the young larvae will immediately begin to feed on a host plant. The feeding larvae use the dwarf plantain (*Plantago erecta*), Patagonia plantain (*P. patagonica*), Coulter’s snapdragon (*Antirrhinum coulterianum*), and Chinese houses (*Collinsia concolor*) as their host plants (Pratt 2009). Stiffbranch bird’s-beak (*Cordylanthus rigidus*) and exserted Indian paintbrush (*Castilleja exserta*) are considered secondary hosts (USFWS 2002).

After feeding, the early larva enters an obligatory aestival diapause (dormant stage), which may be broken after fall or winter rains (Murphy and White 1984; Osborne 1998). If adverse weather conditions occur, the emergent larva may reenter a diapause stage repeatedly, for up to 5 or 6

years, until favorable weather conditions permit sufficient growth of the host plant to allow the larva to complete its development.

The Quino was once common in Southern California. It ranged north into Ventura County, west to the Pacific Ocean, east to the deserts, and south into northern Baja California. Currently, it is known to occur only in a few, probably isolated, colonies in southwestern Riverside County, San Diego County, and northern Baja California.

Reasons for the butterfly's reduction in population are not well understood. Habitat loss due to degradation and fragmentation caused by urban and rural development, agricultural conversion, off-road vehicular use, the invasion of non-native plants and insects, fire management practices, over collecting, and adverse weather conditions have likely contributed to the species' decline (62 FR 2313–2322).

The 2014 U.S. Fish and Wildlife Service protocol states that focused Quino surveys begin the third week of February and end the second Saturday in May unless otherwise approved by the FWS. Surveys must be conducted during the adult flight season by biologists possessing a recovery permit for this species pursuant to Section 10(a)(1)(A) of the Endangered Species Act (USFWS 2014). The 2018 focused surveys followed the 2014 U.S. Fish and Wildlife Service protocol with the addition of an amendment included in the 2018 notification (USFWS 2018). The approved amendment allowed for surveys to begin the week of March 12 to account for the location's higher elevation, generally colder conditions, and generally later start of Quino emergence.

## **Methods**

Prior to the focused surveys, Dudek biologists conducted a habitat assessment within the study area in order to identify suitable habitat and exclude unsuitable habitat. Excluded areas consisted of developed areas and densely vegetated chaparral with tall shrubs forming closed canopies . Host plant surveys were performed in concert with the habitat assessment and augmented during the survey effort.

Focused Quino surveys were conducted over 10 visits between March 3, 2018, and May 15, 2018, per the Quino survey guidelines published on December 15, 2014 (USFWS 2014).<sup>1</sup> The survey area consisted of suitable habitat for Quino (Figures 2 and 3). Surveys were conducted by Quino-permitted biologists Anita Hayworth (TE-781084-9.1), Callie Amoaku (TE-36118B-1), Darin Busby (initially working under Melissa Busby's permit until permit renewal of TE-115373-

4), David Erik LaCoste (TE-027736-6), Diana Saucedo (TE-221287-1), Erin Bergman (TE-813545-5), Jeff Priest (TE-840619-6), Margie Mulligan (TE-88969B-0), Melissa Busby (TE-0807792-3), Patricia Schuyler (TE-27502B-1), Paul M. Lemons (TE-051248-5), and Tricia Wotipka (working under TE-840619-6).

The biologists were provided with 200-scale (1 inch = 200 feet) aerial maps of the survey area. Binoculars were used to aid in detecting and identifying butterfly and other wildlife species. Surveys also focused on identifying Quino host plants; however, only dried host plants from last year were observed. Therefore, no host plants were mapped on site.

The survey methods consisted of slowly walking roughly parallel transects spaced approximately 30 feet (10 meters) apart throughout all suitable habitats within the 699-acre study area. The site was divided into 10 survey areas, ranging from 62 acres to 82 acres (Figures 2 through 6, Survey Results). Survey routes were arranged to thoroughly cover the survey area at a rate of no more than 5 to 10 acres per person hour. All wildlife species observed were recorded and are listed in Appendix A.

Surveys were conducted only during acceptable weather conditions (i.e., surveys were not conducted during fog, drizzle, or rain; winds greater than 15 miles per hour measured 4 to 6 feet above ground level for more than 30 seconds; temperature in the shade at ground level less than 60°F on a clear, sunny day; or temperature in the shade at ground level less than 70°F on an overcast or cloudy day). Survey times, personnel, and conditions during the Quino survey are shown in Table 1. Copies of the surveyors' field notes are included as Appendix B.

Weather conditions at the project site varied throughout the survey season, and numerous surveys were postponed or ended early/began late due to high winds, cloud cover, and/or low temperatures. Because of these weather conditions, some areas were surveyed over 2 days in order to complete the survey. If a survey pass was missed due to sustained inclement weather, a makeup survey was performed on non-consecutive days the following week, in accordance with the protocol (USFWS 2014).

No Quino host plants were observed within the survey areas. Table 3 includes the known and observed adult Quino nectar plants (according to Mattoni et al. 1997; USFWS 2002, 2003; 67 FR 18355–18395). Larval host plants are also included in Table 3 and are in bold print. All plant species that were in bloom were documented in the field notes.
